The Harmonized Health Facility Assessment (HHFA) modules and resource package are a key deliverable of the Health Data Collaborative (HDC) Facility Surveys Working Group. The modules provide a harmonized approach to health facility assessments/surveys, building on existing internationally tested health facility assessment tools, such as the United States Agency for International Development (USAID) Service Provision Assessment (SPA), the World Bank Service Delivery Indicators (SDI), and the WHO/USAID Service Availability and Readiness Assessment (SARA), as well as consolidating best practices and lessons learned through implementation in many countries.

Overall guidance for the development of the HHFA modules and resource package was provided by the HDC Facility Surveys Working Group. Kathryn O'Neill, Amani Siyam, Kavitha Viswanathan and Wendy Venter, of the WHO Division of Data, Analytics and Delivery for Impact, coordinated the development of the modules. Nancy Fronczak provided extensive technical input to the questionnaires and indicators. Ashley Sheffel tested and validated the questionnaires and developed the concept of the modern chartbook. Sherrell Goggin, Jaya Gupta, Boniface Muganda and Timothy Roberton made substantial technical contributions to the HHFA resource package. Technical inputs concerning guidelines, service standards, measurement methods and indicators were provided by multiple WHO technical programmes as well as other agencies within the health sector.

The ministries of health of Kenya and Malawi are gratefully acknowledged for testing the implementation of the HHFA modules.

The HHFA modules and resource package were produced with the support of grants from Bloomberg Philanthropies Data for Health Initiative; Gavi, the Vaccine Alliance; The Global Fund to Fight AIDS, Tuberculosis and Malaria; and the Norwegian Agency for Development Cooperation (Norad).

Overview

The harmonized health facility assessment (HHFA) represents a resource package for conducting standardized health facility surveys. The HHFA enables a comprehensive, external review of the availability of health facility services, the systems that facilities have in place to deliver services at required standards of quality, and the effectiveness of the services. Availability, quality and effectiveness of health services are integral to universal health coverage (UHC) and contribute to achieving the Sustainable Development Goals (SDGs). HHFA data can support health sector reviews, planning and policy-making, and enable evidence-based decision-making for strengthening country health services.

The HHFA builds upon the USAID/WHO Service Availability and Readiness Assessment (SARA) and incorporates components of other key global health facility surveys and indicator lists. It is based on global service standards and uses standardized indicators, questionnaires and data collection methodologies. Standardization of indicators and data collection promotes alignment of health facility survey approaches and enables comparability of results over time and across geographic areas.

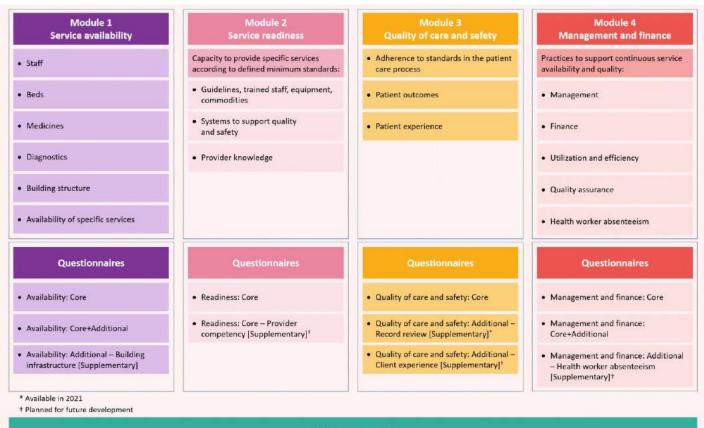

The HHFA includes four modules:

- service availability
- service readiness
- quality and safety of care
- management and finance.

The modular approach, with core and additional indicators, allows countries to adapt the HHFA to their needs. A module is defined as a set of questions (in questionnaire format) and aims to collect information for a defined set of indicators in a specific disease, programme or service management area. Any item of data collected through a health facility assessment should be indicator-driven, i.e. should provide data for the numerator or denominator of a clearly defined indicator and/or research question.

The HHFA questionnaires are provided in two formats: "stand-alone" and "combined". Each of the four HHFA modules has a set of stand-alone questionnaires that may include "core", "core+additional" and/or "supplementary" questionnaires. The "combined" questionnaire contains the questions from all four HHFA modules, integrated and organized by service site or respondent to facilitate data collection at facility level.
